

OutMed Figma Requirement Gap Analysis

Prepared for the UI/UX and Figma development team · 18 August 2026

Overall conclusion: The current Figma provides a useful marketplace UI foundation, but it does not yet represent the complete business workflow defined in the requirements document. Full development should not begin from the current design without first adding the missing critical flows and states.

1. Sources Reviewed

- **Requirements:** “This is the work flow you asked for.pdf” — OutMed Complete Business Workflow, 15 pages.
- **Figma:** OutMed design file, including the supplied product-detail node 80:729 and the full public canvas overview.

2. Business Model That the Design Must Support

OutMed is a B2B marketplace for medical consumables in Saudi Arabia. It connects Buyers, Suppliers, Platform Admin, a Payment Provider, and a Logistics Partner.

The central product model is:

One Master Product → Multiple Supplier Offers → One Purchase Mode per Offer (Instant / Confirmation Required / RFQ) → Payment → Supplier Preparation → Logistics → Delivery → Completion.

3. What Is Currently Visible in Figma

Buyer area

Onboarding, User Interface, Home, Categories, Cart, Messages, and Profile.

Seller area

Onboarding, User Interface, Home, Orders, Add Product, Inventory, and Profile.

Strongest alignment

The product-detail design shows one product page with multiple vendors and prices, plus an Add to Cart action. This is the clearest match to the master-product / multiple-supplier-offer requirement.

4. Detailed Requirement Comparison

Buyer registration

Partial

Buyer onboarding screens exist.

Confirm and design company information, required documents, Primary Account Manager, Buyer Terms acceptance, submission, Admin review, approval, and account activation.

Supplier registration

Partial

Seller onboarding screens exist.

Confirm and design company information, documents, payment/sub-merchant data, Primary Account Manager, Supplier Terms, Admin review, approval, and activation.

Separate Buyer and Supplier Terms

Not visible

No clear separate legal acceptance and management flow is visible.

Add separate acceptance screens and Admin controls to update both legal texts later.

Shared master product catalog

Aligned

Catalog screens and one product page with several vendors are visible.

Preserve one canonical product page and attach supplier offers to it.

New product request and Admin approval

Conflict

Seller area contains a direct “Add Product” section.

Replace with Search Catalog → Add My Offer when found, or Request New Product → Admin review/approve/request changes/reject when not found.

Master product ownership

Not visible

No supplier change-request or Admin correction/deduplication flow is visible.

Only Admin may edit the approved master product. Suppliers must submit change requests.

Supplier offer fields

Partial

Vendor pricing and inventory concepts are visible.

Add price, quantity, MOQ, preparation time, expected availability, guaranteed expiry, and purchase mode.

Buyer offer comparison

Partial

Product detail lists multiple vendors and prices.

Compare supplier, price, availability, delivery time, MOQ, and purchase mode in one clear section.

Instant Purchase

Partial

Add to Cart and Cart screens are present.

Add the complete quantity → cart → checkout → payment → payment success → confirmed order sequence.

Confirmation Required

Not visible

No availability-confirmation request flow is visible.

Add buyer request, supplier confirm/reject/change quantity, buyer notification, checkout, payment, expiry/time-limit, and status states.

RFQ

Not visible

No RFQ flow is visible.

Add multi-product RFQ creation, eligible-supplier distribution, supplier quotations, validity, comparison, selection, checkout, and payment.

Blind buyer privacy

Not visible

No anonymous pre-transaction state is shown.

Before confirmation/payment, hide buyer company, contact name, phone, email, and exact address. Show only product, quantity, general delivery area, and required date.

Payment methods

Not visible

No payment flow is visible.

Add mada, cards, Apple Pay, processing, success, failure, retry, and payment record screens.

Split settlement

Not visible

No commission split or supplier settlement status is visible.

Represent Supplier Share, Platform Commission, delayed settlement if applicable, and settlement release after delivery.

Order preparation

Partial

Seller Orders screens exist.

Clearly design Paid/Confirmed → Preparing → Ready for Pickup and related buyer/supplier states.

Logistics and delivery tracking

Not visible

No logistics lifecycle is visible.

Add delivery request, supplier pickup, in transit, buyer tracking, delivered, and exception/delay states.

Proof of Delivery and completion

Not visible

No Proof of Delivery, dispute gate, or completion state is visible.

Add POD, delivery confirmation, dispute handling, settlement release, and completed order states.

Invoices and order records

Not visible

No clear invoice or downloadable order record is visible.

Add basic invoices and order records for Phase 1.

Admin application

Not visible

No Admin area is visible in the design overview.

Add account approvals, product review/correction/deduplication, legal terms management, product change requests, order oversight, and dispute/settlement visibility.

5. Required Figma Work Before Development

1 P0 — Correct the product architecture: replace direct Seller “Add Product” with catalog search, Add My Offer, and Request New Product with Admin approval.

2 P0 — Design all three purchase modes: Instant, Confirmation Required, and RFQ must have separate buyer and supplier flows and statuses.

3 P0 — Add Admin workflows: registration approvals, master-product review, duplicate checking, correction, approval/rejection/change request, and editable legal terms.

4 P0 — Complete registration: include company data, documents, Primary Account Manager, role-specific terms, submission, review, approval, and activation.

5 P1 — Add payment and settlement: checkout, mada/cards/Apple Pay, payment result states, split settlement, commission, and supplier settlement.

6 P1 — Add fulfillment: preparation, Ready for Pickup, logistics request, pickup, tracking, delivery, Proof of Delivery, dispute, and completion.

7 P1 — Add privacy states: hide buyer identity and exact address during Confirmation Required and RFQ until transaction confirmation.

8 P2 — Add records and exceptions: invoices, order history, failed payment, supplier rejection, partial availability, delayed delivery, dispute, and cancellation states.

6. Recommended Figma Organization

Create separate pages or clearly separated sections for:

- Buyer — Registration and Account Approval
- Supplier — Registration and Payment Onboarding
- Admin — Account, Product, Legal Terms, Orders, and Disputes
- Master Catalog and Supplier Offers
- Instant Purchase
- Confirmation Required
- RFQ
- Checkout, Payment, and Split Settlement
- Order Preparation and Logistics
- Delivery Tracking, Proof of Delivery, Invoice, and Completion

Design handoff rule: Every screen should identify the actor, entry condition, primary action, success state, failure/empty state, and next order status. Prototype links should demonstrate each end-to-end journey, not only isolated screens.

7. Final Decision

Status: Not ready for complete development handoff.

The current design can be retained as the visual foundation for catalog browsing, product detail, vendor display, cart, profiles, seller inventory, and basic orders. The missing business-critical flows above should be designed and reviewed against the requirements document before implementation begins.

Review limitation: This report is based on the public Figma canvas overview and supplied product-detail node. Some small onboarding field labels and hidden prototype states could not be independently verified; these are marked Partial or Not visible rather than assumed complete.
